SIXFOLD · LAND & FIRE

Every Ridge mark, in the order we drew them

Four versions. The ridge itself has never changed — same five slopes, same coordinates, since the mark was picked. What has changed is the left end and the ground line.

THE FOUR

Same scale, aligned on the ground line

01

PLAY THE SPROUT

All four animate together, so the differences land side by side.

WHAT CHANGED, AND WHY

01 · Ridge, as approved

18 AUG

Five slopes rising left to right, the smallest in moss, on a solid ground line. Chosen over Sweep for the flyers because it holds up better in the hand.

> WHERE IT STOOD
> Signed off, and still the mark inside every sheet and flyer built so far.

02 · Tree and first roots

19 AUG · FIRST PASS

The smallest slope becomes a conifer, drawn in front of the ridge rather than behind it, and the ground line puts roots down at its right corner. The canvas grew 16 units taller to make room.

> WHY IT MOVED ON
> The tree landed. The roots did not — three thick strands all curving the same way read as a swoosh or a tail, not a root system.

03 · Zigzag roots

19 AUG · REVISION

Each strand kinks five or six times instead of bending once, and the kinks are deliberately out of step with each other — roots change direction when they hit resistance, so a strand that bends on a regular beat still reads as decoration.

> WHY IT MOVED ON
> Read as roots for the first time. Still heavy — four thick strands crowded the corner and the mass fought the ridge for attention.

04 · Thin and branching

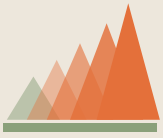

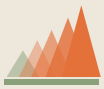

19 AUG · CURRENT

The strands drop to roughly half weight, which frees room for ten instead of four. Six of them are finer, and two branch off strands already underground rather than starting at the line.

> WHERE IT STANDS
> Thinning the four on their own went weak and sparse — thin only works at this density. Below about 32px the root mass softens into texture rather than separate roots.

AT THE SIZES IT WILL ACTUALLY BE USED — 104px letterhead · 40px avatar · 26px favicon

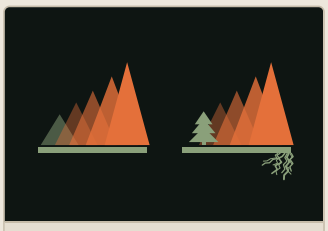

This row decided three of the four revisions. A mark that only works at poster size is not finished.

ON THE OTHER GROUNDS

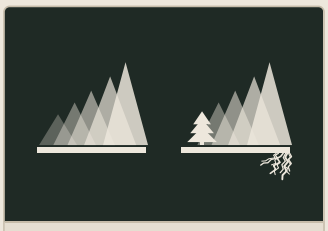

Version one and version four, on each of the brand's four fields. Single-colour versions use the same shapes with the ember stepping down in opacity.

PINE BLACK

BONE

TIMBER, SINGLE COLOUR

EMBER, SINGLE COLOUR

TRIED AND SET ASIDE

Drawings that did not make it, kept because they are the argument for the one that did. Each failed on the same test — whether it still reads as a root system when it gets small.

The first roots

Only twelve units of depth under the line. Everything curved the same way and it read as a flourish. This is why the canvas got taller.

Tapered wedges

Solid shapes narrowing to a point, to match the flat triangles above. They tapered too far and went wispy — closer to grass than root.

Harder kinks, sharp joins

Pushing the zigzag further and sharpening the corners tipped it into lightning, or cracked glass. There is a ceiling on how much a root can deviate.

Thin, but still four

The obvious way to go thin: keep the four strands and halve the weight. The corner went underfed, and the roots vanished below about 60px.

Thick, with branches

Branching roots off thick strands. It is the right idea at the wrong weight — the corner clotted into a single mass at anything under poster size.

FOR THE RECORD

- The ridge silhouette is untouched across all four. Versions two to four sit on a taller canvas — `viewBox="0 0 100 116"` instead of `0 0 100 100` — and the extra 16 units are root depth only.
- Nothing is published or live. The masters are `sixfold-mark-ridge.svg` and `sixfold-mark-ridge-mono.svg`; eleven copies of version one are still inlined across the marketing sheets, the content set and the flyers, and have deliberately not been swept.
- Ridge still never rotates, and it was never tilted. Only Sweep rotates, and only in 60° steps.
